TITLE OF THE INVENTION

THROMBIN INHIBITORS

BACKGROUND OF THE INVENTION

5 Thrombin is a serine protease present in blood plasma in the form of a precursor, prothrombin. Thrombin plays a central role in the mechanism of blood coagulation by converting the solution plasma protein, fibrinogen, into insoluble fibrin.

 Edwards *et al.*, *J. Amer. Chem. Soc.*, (1992) vol. 114, pp.
10 1854-63, describes peptidyl α -ketobenzoxazoles which are reversible inhibitors of the serine proteases human leukocyte elastase and porcine pancreatic elastase.

 European Publication 363 284 describes analogs of peptidase substrates in which the nitrogen atom of the scissile amide
15 group of the substrate peptide has been replaced by hydrogen or a substituted carbonyl moiety.

 Australian Publication 86245677 also describes peptidase inhibitors having an activated electrophilic ketone moiety such as fluoromethylene ketone or α -keto carboxyl derivatives.

20 Thrombin inhibitors described in prior publications contain sidechains of arginine and lysine. These structures show low selectivity for thrombin over other trypsin-like enzymes. Some of them show toxicity of hypotension and liver toxicity.

 European Publication 601 459 describes sulfonamido
25 heterocyclic thrombin inhibitors, such as N-[4-[(aminoimino-methyl)amino]butyl]-1-[N-(2-naphthalenylsulfonyl)-L-phenylalanyl]-L-prolinamide.

 WO 94/29336 describes compounds which are useful as
30 thrombin inhibitors.

SUMMARY OF THE INVENTION

Compounds of the invention have the following structure:

- 5 wherein
 A is C or N;
 X¹, X² and X³, each independently attached to a ring carbon atom, are
 independently selected from the group consisting of
 hydrogen, C₁-4 alkyl, and C₁-4 alkoxy;
 10 Y, attached to a ring carbon atom, is H, NH₂ or OH;
 Z is -(CH₂)₁₋₃;
 R¹, R², and R^{2'} are independently
 hydrogen,
 phenyl,
 15 mono- or di-halogenated phenyl,
 naphthyl,
 biphenyl,
 a 5- to 10-membered mono- or bicyclic heterocyclic ring or
 bicyclic heterocyclic ring system any ring of which may be
 20 saturated or unsaturated, and which consists of carbon atoms and
 from one to three heteroatoms selected from the group consisting
 of N, O and S,
 C₁-4 alkyl,
 branched C₁-4 alkyl,
 25 C₃-7 cycloalkyl,
 C₅-12 bicyclic alkyl,
 C₁₁-16 tricyclic alkyl,

and pharmaceutically acceptable salts thereof.

25 These compounds show selectivity for thrombin inhibition over inhibition of trypsin and other trypsin-like enzymes. Trypsin-like enzymes (such as trypsin, thrombin, factor xa, kallikrein, plasmin, urokinase, and plasminogen activator) are serine dependent enzymes that catalyze hydrolysis at arginyl and lysyl peptide bonds.

30 The invention includes a composition for inhibiting loss of blood platelets, inhibiting formation of blood platelet aggregates, inhibiting formation of fibrin, inhibiting thrombus formation, and inhibiting embolus formation in a mammal, comprising a compound of the invention in a pharmaceutically acceptable carrier. These compositions may optionally include anticoagulants, antiplatelet agents,

- 5 -

and thrombolytic agents. The compositions can be added to blood, blood products, or mammalian organs in order to effect the desired inhibitions.

The invention also includes a composition for preventing or treating unstable angina, refractory angina, myocardial infarction, transient ischemic attacks, atrial fibrillation, thrombotic stroke, embolic stroke, deep vein thrombosis, disseminated intravascular coagulation, ocular build up of fibrin, and reocclusion or restenosis of recanalized vessels, in a mammal, comprising a compound of the invention in a pharmaceutically acceptable carrier. These compositions may optionally include anticoagulants, antiplatelet agents, and thrombolytic agents.

The invention also includes a method for reducing the thrombogenicity of a surface in a mammal by attaching to the surface, either covalently or noncovalently, a compound of the invention.

DETAILED DESCRIPTION OF THE INVENTION

Compounds of the invention have the following structure:

30 The compounds of the present invention may have chiral centers and occur as racemates, racemic mixtures and as individual diastereomers, or enantiomers with all isomeric forms being included in the present invention. A racemate or racemic mixture does not imply a 50:50 mixture of stereoisomers.

When any variable occurs more than one time in any constituent or in formula I, its definition on each occurrence is independent of its definition at every other occurrence. Also,

- 20 -

combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

As used herein except where noted, "alkyl" is intended to include both branched- and straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms (Me is methyl, Et is ethyl, Pr is propyl, Bu is butyl); "alkoxy" represents an alkyl group of indicated number of carbon atoms attached through an oxygen bridge; "Halo", as used herein, means fluoro, chloro, bromo and iodo; and "counterion" is used to represent a small, single negatively-charged species, such as chloride, bromide, hydroxide, acetate, trifluoroacetate, perchlorate, nitrate, benzoate, maleate, tartrate, hemitartrate, benzene sulfonate, and the like.

Cyclic alkyl, bicyclic alkyl, and tricyclic alkyl refer to saturated ring systems, including spiro systems, fused systems, and bridged systems, unsubstituted or substituted with oxygen to form carbonyl carbon systems, or C₁₋₂ alkyl.

The term heterocycle or heterocyclic, as used herein except where noted, represents a stable 5- to 7-membered mono- or bicyclic or stable 7- to 10-membered bicyclic heterocyclic ring system any ring of which may be saturated or unsaturated, and which consists of carbon atoms and from one to three heteroatoms selected from the group consisting of N, O and S, and wherein the nitrogen and sulfur heteroatoms may optionally be oxidized, and the nitrogen heteroatom may optionally be quaternized, and including any bicyclic group in which any of the above-defined heterocyclic rings is fused to a benzene ring. The heterocyclic ring may be attached at any heteroatom or carbon atom which results in the creation of a stable structure. Examples of such heterocyclic elements include piperidinyl, piperazinyl, 2-oxopiperazinyl, 2-oxopiperidinyl, 2-oxopyrrolodinyl, 2-oxoazepinyl, azepinyl, pyrrolyl, 4-piperidonyl, pyrrolidinyl, pyrazolyl, pyrazolidinyl, imidazolyl, imidazolinyl, imidazolidinyl, pyridyl, pyrazinyl, pyrimidinyl, pyridazinyl, oxazolyl, oxazolidinyl, isoxazolyl, isoxazolidinyl, morpholinyl, thiazolyl, thiazolidinyl, isothiazolyl, quinuclidinyl, isothiazolidinyl, indolyl, quinolinyl, isoquinolinyl,

- 21 -

benzimidazolyl, thiadiazoyl, benzopyranyl, benzothiazolyl, benzoxazolyl, furyl, tetrahydrofuryl, tetrahydropyranyl, thienyl, benzothienyl, thiamorpholinyl, thiamorpholinyl sulfoxide, thiamorpholinyl sulfone, and oxadiazolyl. Morpholino is the same as morpholinyl.

The pharmaceutically-acceptable salts of the compounds of Formula I (in the form of water- or oil-soluble or dispersible products) include the conventional non-toxic salts or the quaternary ammonium salts which are formed, e.g., from inorganic or organic acids or bases. Examples of such acid addition salts include acetate, adipate, alginate, aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, citrate, camphorate, camphorsulfonate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, fumarate, glucoheptanoate, glycerophosphate, hemisulfate, heptanoate, hexanoate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethanesulfonate, lactate, maleate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, oxalate, pamoate, pectinate, persulfate, 3-phenylpropionate, picrate, pivalate, propionate, succinate, tartrate, thiocyanate, tosylate, and undecanoate. Base salts include ammonium salts, alkali metal salts such as sodium and potassium salts, alkaline earth metal salts such as calcium and magnesium salts, salts with organic bases such as dicyclohexylamine salts, N-methyl-D-glucamine, and salts with amino acids such as arginine, lysine, and so forth. Also, the basic nitrogen-containing groups may be quaternized with such agents as lower alkyl halides, such as methyl, ethyl, propyl, and butyl chloride, bromides and iodides; dialkyl sulfates like dimethyl, diethyl, dibutyl and diamyl sulfates, long chain halides such as decyl, lauryl, myristyl and stearyl chlorides, bromides and iodides, aralkyl halides like benzyl and phenethyl bromides and others.

Amide couplings used to form the compounds of this invention are typically performed by the carbodiimide method with reagents such as dicyclohexylcarbodiimide, or 1-ethyl-3-(3-dimethylaminopropyl) carbodiimide. Other methods of forming the amide or peptide bond include, but are not limited to the synthetic routes via an acid chloride, azide, mixed anhydride or activated ester. Typically,

- 22 -

solution phase amide coupling are performed, but solid-phase synthesis by classical Merrifield techniques may be employed instead. The addition and removal of one or more protecting groups is also typical practice.

EXAMPLE 1Preparation of BOC-D-3,3-Dicyclohexylalanyl-6-(aminopyridin-3-yl)methyl-L-prolineamide

5

Step A: Preparation of 6-Amino-3-aminomethylpyridine

A 300-ml flask was dried in an oven and cooled down in a dry nitrogen atmosphere. The flask was equipped with a rubber syringe cap and a magnetic stirring bar. The flask was immersed in a ice-water bath, and 21 ml (21 mmole) of 1.0M borane solution in THF was introduced into the reaction flask, followed by 0.3 ml of THF. Then 6-Aminonicotinamide (420 mg, 3.06 mmole) in 10 ml of THF was introduced. The resulting mixture was stirred for 10 min, and 5 ml of 6N HCl was added slowly, and then 15.0 ml of H₂O and 100 ml of MeOH was introduced, and stirred continually over night, and filtered, evaporated *in vacuo* to give product as a white solid which was further purified by chromatography using two columns of 40 g silica gel 60 (E. Merck) each and eluting with n-Butanol-HOAc-H₂O (4:1:2); Fractions containing product were combined to give 285 mg (76% yield) of product.

EI⁺: 123TLC: R_f=0.51, silica gel, n-Butanol-HOAc-H₂O (4:1:2);Step B: Boc-D-3,3-Dicha-OH (1-2)

25

A solution of BOC-D-3,3-Diphe-OH (2.0 g, 5.8 mmol) in 50 ml acetic acid/10 ml H₂O was hydrogenated at 62 psi on a Parr apparatus over 400 mg of Ir black catalyst. After 24 h, a second portion of catalyst was added and the reaction continued for a second 24 h interval. The reaction was filtered through a Celite pad, and the filtrate was added with 150 ml of H₂O and filtrated again to give 2.0 g of BOC-D-3,3-Dicha as white solid (97% yield).

- 55 -

Step C: Boc-D-3,3-Dicha-Pro-OMe (1-3)

To a solution of Boc-D-3,3-Dicha-OH (1.77 g, 5.0 mmol) and H-Pro-OMe•HCl (0.91 g, 5.5 mmol) in 12 ml of DMF was added 4.6 g (6.0 mmol) of HOBt•H₂O, the pH of the solution was adjusted to 8 (moist narrow pH paper), and EDC (6.47 g, 6.76 mmol) was added with magnetic stirring. After 3.5 hrs the reaction was quenched by the addition of 10 ml of water. After keeping the mixture at room temperature for 5 hrs, the solvents were evaporated at reduced pressure and the residue was dissolved in EtOAc-H₂O. Aqueous KHSO₄ was added to this two-phase mixture and the layers were separated. The organic layer was extracted with NaHCO₃, saturated NaCl, and dried over MgSO₄. The solvent was evaporated to give product as a white solid which was further purified by chromatography using two columns of 600 g silica gel 60 (E. Merck) each and eluting with EtOAc-hexane (2:8). Fractions containing product were combined to give 2.26 g (97% yield) of product.

In a similar manner are prepared the following:

N-(benzylsulfonyl)-D-3,4-Dichloro-Phe-Pro-OMe (2-2), by coupling of N-(benzylsulfonyl)-D-3,4-Dichloro-Phe-OH (2-1) with H-Pro-OMe•HCl.

BOC-D-3, 3-Diphe-Pro-OMe (3-1), by coupling of Boc-D-3,3-Diphe-OH with H-Pro-OMe•HCl.

Step D: Boc-D-3,3-Dicha-Pro-OH

A sample of Boc-D-3,3-Dicha-Pro-OMe (1.76 g, 3.8 mmol) dissolved in 100 ml of 1:1(v/v) MeOH/H₂O was treated with 2.2 N LiOH (2.2 ml) in portions over 1.5 hrs. keeping the pH at 12-13. After 3.5 hrs, the reaction solution was adjusted to pH 7 with dilute KHSO₄ solution, 100 ml of EtOAc and 50 ml of H₂O were added, and the aqueous layer was further adjusted to pH 2 with KHSO₄ solution. The organic layer was separated and washed twice with 50% saturated NaCl solution, dried over Na₂SO₄, and evaporated *in vacuo* to give 1.64 g, (96% yield).

NMP was treated with DIEA to PH 8.5, and the resulting solution stirred at room temp. in an N₂ atmosphere for 8 h. The reaction was diluted with 3X its volume of water, and the suspension stirred vigorously at room temp. for 15 min. The suspension was filtered, the residue purified by preparative HPLC using a trifluoroacetic acid (0.1%)-CH₃CN gradient. Lyophilization of pure fractions gave 135 mg (97%) of product as a trifluoroacetic acid hydrate salt.

Preparation of N-(t-butyloxy-carboxymethyl)-D-4-chlorophenyl-alanyl-N-(6-aminopyridin-3-yl)methyl-L-proline amide

15 Step A: Preparation of 6-amino-3-(aminomethyl)pyridine

To 6-aminonicotinamide (11.0 g, 80.21 mmol) suspended in 500 mL of THF was added solid lithium aluminum hydride (6.35 g, 167.3 mmol) portionwise. This mixture was refluxed for 72 h, cooled to RT and quenched by the addition of water (4.71 mL), 1N NaOH (4.71 mL) and then water (19 mL). After 1 h of vigorous stirring the mixture was filtered through celite and washed with 500 mL of THF:MeOH (85:15). The volatiles were removed *in vacuo* and the solid was purified by flash column chromatography (60 x 150 mm column of SiO₂, EtOH/NH₄OH gradient elution 99:1, 98:2 97:3) to afford 3.70 g (37% yield) of a white solid: TLC (EtOH:NH₄OH, 99:1) R_f = 0.16; ¹H NMR (400 MHz, CDCl₃) δ 1.54 (br s, 2H), 3.73 (s, 2H), 4.50 (br s, 2H), 6.48 (d, J = 8.4 Hz, 1H), 7.42 (dd, J = 8.3 and 2.3 Hz, 1H), 7.99 (d, J = 1.6 Hz, 1H).

30 Step B: Preparation of N-Boc-D-4-chlorophenylalanyl-L-proline methyl ester

To a solution of N-Boc-D-4-chlorophenylalanine (2.72 g, 9.07 mmol), L-proline methyl ester hydrochloride (1.50 g, 9.07 mmol), EDC (2.08 g, 10.884 mmol), and HOBt (1.51 g, 10.884 mmol) in 15

EXAMPLE 13

Preparation of N-(2R)-azido-3-(3,4-methylenedioxyphenyl)alanyl-N-(6-amino-2-methylpyridin-3-yl)methyl- L-proline amide

5

Step A: Preparation of 6-amino-3-cyano-2-methylpyridine

To a solution of 6-amino-3-bromo-2-methylpyridine (20.0g 0.1069 mol) in 40 mL of DMF was added copper(I) cyanide (11.50 g, 0.128 mol). The reaction mixture was refluxed under argon for 10 h, cooled to 80°C and poured into a solution of NaCN (21.50 g) dissolved in 70 mL water. This stirred for 1 h and was extracted with ethyl acetate (4 x 100 mL). The combined organic layer was washed with 10% NaCN (1 x 75 mL), water (1 x 75 mL) and brine (1 x 50 mL) and dried over MgSO₄. The solution was filtered, concentrated and the residue was triturated with ethyl acetate and hexanes to provide the product as a tan solid (8.90 g): ¹H NMR (300 MHz, CDCl₃) δ 2.55 (s, 3H), 5.39 (br s, 2H), 6.35 (d, J = 8.55 Hz, 1H), 7.54 (d, J = 8.54 Hz, 1H).

20 Step B: Preparation of the dihydrochloride of 6-amino-3-(aminomethyl)-2-methylpyridine

To a solution of 6-amino-3-cyano-2-methylpyridine (10.38 g 78.04 mmol) in 300 mL of ethanol/ methanol (3:1) and 30 mL of 6N HCl was added 10% Pd/C (5.00 g). The solution was flushed with hydrogen and vigorously stirred. After 14 h the mixture was filtered through celite and washed with 500 mL of methanol. The volatiles were removed *in vacuo* to provide a yellow solid : ¹H NMR (300 MHz, CDCl₃) δ 2.59 (s, 3H), 4.12 (s, 2H), 4.89 (s, 6H), 6.94 (d, J = 9.1 Hz, 1H), 7.96 (d, J = 9.2 Hz, 1H).

30

Step C: Preparation of (4R)-3-(3-(3,4-methylenedioxyphenyl)-1-oxopropyl)-4-(phenylmethyl)-2-oxazolidinone

To a solution of 3-(3,4-methylenedioxyphenyl)propionic acid (10.93 g, 0.0563 mol) dissolved in THF was added triethylamine

- 68 -

(8.22 mL, 0.0589 mol) and cooled to -78°C . Trimethylacetylchloride (6.93 mL, 0.0563 mol) was added dropwise and the reaction was warmed to 0°C for 0.5 h and re-cooled to -78°C . To this was added a solution of (4R)-(3-phenylmethyl)-2-oxazolidinone (9.49 g, 0.0536 mol) and n-BuLi (22.5 mL, 2.5 M in hexanes, 0.563 mol) in 150 mL THF after stirring for 1 h at -78°C via cannula. After 1 h the reaction was warmed to 0°C and stirred an additional 2 h then quenched with 100 mL of 1/2 sat'd NH_4Cl . The aqueous layer was extracted with ethyl acetate (3 x 100 mL) and the combined organic layer was washed with sat'd NaHCO_3 (1x100 mL), water (1x100 mL), and brine (1x100 mL), dried over MgSO_4 , filtered and concentrated to an oil. Recrystallization from ethyl acetate and hexanes afforded 15.17 g (76% yield) of white crystalline product: mp $86-87^{\circ}\text{C}$.

15 Step D: Preparation of (3(2R),4R)-3-(2-azido-3-(3,4-methylene-dioxyphenyl)-1-oxopropyl)-4-(phenylmethyl)-2-oxazolidinone

To a solution of N-(4R)-3-(3,4-methylenedioxyphenyl)-1-oxopropyl)-4-(phenylmethyl)-2-oxazolidinone (7.59 g, 21.5 mmol) dissolved in THF and cooled to -78°C was added KHMDS (46.0 mL, 0.5 M in toluene, 23.0 mmol) dropwise. After 1 h a pre-cooled solution (-78°C) of trisyl azide (7.46 g, 24.15 mmol) dissolved in THF (50 mL) was added via cannula. The reaction was quenched with glacial acetic acid (7.0 mL) after 3 minutes and stirred at RT for 6 h. Saturated NH_4Cl (50 mL) was added and the aqueous was extracted with ethyl acetate (2 x 75 mL). The combined organic layer was washed with sat'd NaHCO_3 (2 x 50 mL), water (1 x 50 mL), brine (1 x 50 mL), dried over MgSO_4 , filtered and concentrated *in vacuo*. The solid was recrystallized from ethyl acetate and hexanes to afford 5.74 g of a yellow white solid. mp $125-132^{\circ}\text{C}$; ^1H NMR (400 MHz, CDCl_3) δ 2.83 (dd, $J=13.4$ and 9.5Hz , 1H), 2.94 (dd, $J=13.6$ and 9.2Hz , 1H), 3.13 (dd, $J=13.7$ and 5.1Hz , 1H), 3.33 (dd, $J=13.4$ and 3.0Hz , 1H), 4.15-4.23 (m, 2H), 4.62-4.66 (m, 1H), 5.19 (dd, $J=9.1$ and 5.1Hz , 1H), 5.94 (s, 2H), 6.76-6.82 (m, 2H), 7.20-7.36 (m, 5H).

Step E: Preparation of N-(2R)-azido-3-(3,4-methylene-dioxyphenyl)-1-propanoic acid

To a solution of (3(2R),4R)-3-(2-azido-3-(3,4-methylene-dioxyphenyl)-1-oxopropyl)-4-(phenylmethyl)-2-oxazolidinone (5.743 g, 14.57 mmol) dissolved in 75 mL of dioxane cooled to 0°C was added a solution of LiOH (0.419 g, 17.49 mmol) dissolved in water (25 mL) and 30% H₂O₂ (8.27 mL). After 0.5 h ethyl acetate was added (15 mL) and the solution was concentrated to 25 mL *in vacuo*. The aqueous layer was acidified to pH 2 with 10% HCl and extracted with ethyl acetate (3x75 mL), the combined organic layer was washed with water (1x20 mL), brine (1x20 mL), dried over MgSO₄, filtered and concentrated to an oil. This material was used directly in the next step.

Step F: Preparation of N-(2R)-azido-3-(3,4-methylene-dioxyphenyl)alanyl-L-proline methyl ester

To a solution of (2R)-azido-3-(3,4-methylenedioxyphenyl)-1-propanoic acid (from above) dissolved in 30 mL of DMF was added L-proline methyl ester hydrochloride (2.53 g, 15.30 mmol), HOBt (2.06 g, 15.30 mmol), EDC (2.93 g, 15.30 mmol), cooled to 0°C and then added triethylamine (4.46 mL, 32.06 mmol). After 1 h the reaction was warmed to RT and stirred 18 h, then diluted with ethyl acetate (300 mL) and washed with sat'd NaHCO₃ (1x50 mL), water (3x50 mL), brine (1x50 mL), dried over MgSO₄, filtered and concentrated to an oil. The residue was purified by flash column chromatography (40 x 150 mm column of SiO₂, EtOAc:Hex gradient elution 1:2 1000 mL, to 1:1 500 mL) to afford 3.26 g of waxy solid. Step G: Preparation of N-(2R)-azido-3-(3,4-methylene-dioxyphenyl)alanyl-L-proline carboxylic acid

To N-(2R)-azido-3-(3,4-methylenedioxyphenyl)alanyl-L-proline methyl ester (0.84 g, 2.43 mmol) dissolved in 6 mL of THF cooled to 0°C was added a solution of LiOH (0.62 g, 2.58 mmol) in 2 mL of water. After 0.5 h reaction was quenched by the addition of ethyl acetate (10 mL) and concentrated to a 3 mL volume. The solution was acidified to pH 2 with 10% HCl and extracted with ethyl acetate (3x 25mL). the organic layer was washed with water (1x10 mL), and brine (1 x 5 mL), dried over MgSO₄, filtered and concentrated to a white solid (0.748 g, 93% yield). ¹H NMR (400 MHz, CDCl₃) δ 1.81-1.98 (m, 3H), 2.25-2.28 (m, 1H), 2.96-3.19 (m, 3H), 3.55-3.62 (m, 2H), 3.85 (dd, J = 8.1 and 6.9 Hz, 1H), 4.49 (dd, J = 7.9 and 2.9 Hz, 1H), 5.94 (s, 2H), 6.68-6.76 (m, 3H).

Step H: Preparation of N-(2R)-azido-3-(3,4-methylene-dioxyphenyl)alanyl-N-(6-amino-2-methylpyridin-3-yl)methyl-L-proline amide

To a solution of (2R)-azido-3-(3,4-methylenedioxyphenyl)alanyl-L-proline carboxylic acid (0.319 g, 0.961 mmol) dissolved in 4 mL of DMF was added 6-amino-3-(aminomethyl)-2-methylpyridine dihydrochloride (0.222 g, 1.05 mmol), EDC (0.202 g, 1.05 mmol), and HOBt (0.142 g, 1.05 mmol), cooled to 0°C and added the triethylamine (0.428 mL, 3.074 mmol). The reaction was warmed to RT after 1h and quenched after 16 h by diluting into 100 mL of ethyl acetate and washed with sat'd NaHCO₃ (1x25 mL), water (4x25 mL), brine (1x20 mL), dried over MgSO₄, filtered and concentrated to a foam. Flash column chromatography (25x150 mm column of SiO₂, CH₂Cl₂/CH₂Cl₂ saturated with NH₃/MeOH gradient elution 60:38:2 to 60:37:3) provided 0.324 g of an oil: TLC (CH₂Cl₂/CH₂Cl₂ saturated NH₃/MeOH, 60:30:10) R_f = 0.34; ¹H NMR (400 MHz, CDCl₃) δ 1.61-1.79 (m, 2H), 2.01-2.07 (m, 2H), 2.35 (s, 3H), 2.85-2.90 (m, 1H), 3.01 (dd, J=13.4 and 6.6Hz, 1H), 3.14 (dd, J=13.4 and 8.4Hz, 1H), 3.50 (t, J=2.7Hz, 1H), 3.83 (dd, J=8.4 and 6.6Hz, 1H), 4.20-4.31 (m, 2H), 4.42

K_i for thrombin is the inhibition constant for the tested compound with human thrombin. K_i for trypsin is the inhibition constant for the tested compound with bovine trypsin. Rate constants
10 were determined using the following *in vitro* procedures.

In vitro assay for determining proteinase inhibition

Assays of human α -thrombin and bovine trypsin were
15 performed at 25°C in 0.05 M TRIS buffer pH 7.4, 0.15 M NaCl, 0.1% PEG. Trypsin assays also contained 1 mM $CaCl_2$.

In assays wherein rates of hydrolysis of a *p*-nitroanilide (pna) substrate were determined, a Thermomax 96-well plate reader was used was used to measure (at 405 nm) the time dependent
20 appearance of *p*-nitroaniline. sar-PR-pna (sarcosine-Pro-Arg-*p*-nitroanilide) was used to assay human α -thrombin ($K_m=125 \mu M$) and bovine trypsin ($K_m=125 \mu M$). *p*-Nitroanilide substrate concentration was determined from measurements of absorbance at 342 nm using an extinction coefficient of $8270 \text{ cm}^{-1} \text{ M}^{-1}$.

25 In certain studies with potent inhibitors ($K_i < 10 \text{ nM}$) where the degree of inhibition of thrombin was high, a more sensitive activity assay was employed. In this assay the rate of thrombin catalyzed hydrolysis of the fluorogenic substrate Z-GPR-afc (Cbz-Gly-Pro-Arg-7-amino-4-trifluoromethyl coumarin) ($K_m=27 \mu M$) was
30 determined from the increase in fluorescence at 500 nm (excitation at 400 nm) associated with production of 7-amino-4-trifluoromethyl coumarin. Concentrations of stock solutions of Z-GPR-afc were determined from measurements of absorbance at 380 nm of the 7-

- 75 -

amino-4-trifluoromethyl coumarin produced upon complete hydrolysis of an aliquot of the stock solution by thrombin.

Activity assays were performed by diluting a stock solution of substrate at least tenfold to a final concentration $\leq 0.1 K_m$ into a solution containing enzyme or enzyme equilibrated with inhibitor. Times required to achieve equilibration between enzyme and inhibitor were determined in control experiments. Initial velocities of product formation in the absence (V_o) or presence of inhibitor (V_i) were measured. Assuming competitive inhibition, and that unity is negligible compared $K_m/[S]$, $[I]/e$, and $[I]/e$ (where $[S]$, $[I]$, and e respectively represent the total concentrations, of substrate, inhibitor and enzyme), the equilibrium constant (K_i) for dissociation of the inhibitor from the enzyme can be obtained from the dependence of V_o/V_i on $[I]$ shown in equation 1.

$$V_o/V_i = 1 + [I]/K_i \quad (1)$$

The activities shown by this assay indicate that the compounds of the invention are therapeutically useful for treating various conditions in patients suffering from unstable angina, refractory angina, myocardial infarction, transient ischemic attacks, atrial fibrillation, thrombotic stroke, embolic stroke, deep vein thrombosis, disseminated intravascular coagulation, and reocclusion or restenosis of recanalized vessels.

Thrombin Inhibitors - Therapeutic Uses

Anticoagulant therapy is indicated for the treatment and prevention of a variety of thrombotic conditions, particularly coronary artery and cerebrovascular disease. Those experienced in this field are readily aware of the circumstances requiring anticoagulant therapy. The term "patient" used herein is taken to mean mammals such as primates, including humans, sheep, horses, cattle, pigs, dogs, cats, rats, and mice.

- 76 -

Thrombin inhibition is useful not only in the anticoagulant therapy of individuals having thrombotic conditions, but is useful whenever inhibition of blood coagulation is required such as to prevent coagulation of stored whole blood and to prevent coagulation in other biological samples for testing or storage. Thus, thrombin inhibitors can be added to or contacted with any medium containing or suspected of containing thrombin and in which it is desired that blood coagulation be inhibited, e.g. when contacting the mammal's blood with material selected from the group consisting of vascular grafts, stents, orthopedic prosthesis, cardiac prosthesis, and extracorporeal circulation systems

The thrombin inhibitors of the invention can be administered in such oral forms as tablets, capsules (each of which includes sustained release or timed release formulations), pills, powders, granules, elixers, tinctures, suspensions, syrups, and emulsions. Likewise, they may be administered in intravenous (bolus or infusion), intraperitoneal, subcutaneous, or intramuscular form, all using forms well known to those of ordinary skill in the pharmaceutical arts. An effective but non-toxic amount of the compound desired can be employed as an anti-aggregation agent. For treating ocular build up of fibrin, the compounds may be administered intraocularly or topically as well as orally or parenterally.

The thrombin inhibitors can be administered in the form of a depot injection or implant preparation which may be formulated in such a manner as to permit a sustained release of the active ingredient. The active ingredient can be compressed into pellets or small cylinders and implanted subcutaneously or intramuscularly as depot injections or implants. Implants may employ inert materials such as biodegradable polymers or synthetic silicones, for example, Silastic, silicone rubber or other polymers manufactured by the Dow-Corning Corporation.

The thrombin inhibitors can also be administered in the form of liposome delivery systems, such as small unilamellar vesicles, large unilamellar vesicles and multilamellar vesicles. Liposomes can be formed from a variety of phospholipids, such as cholesterol, stearylamine or phosphatidylcholines.

- 77 -

The thrombin inhibitors may also be delivered by the use of monoclonal antibodies as individual carriers to which the compound molecules are coupled. The thrombin inhibitors may also be coupled with soluble polymers as targetable drug carriers. Such polymers can include polyvinylpyrrolidone, pyran copolymer, polyhydroxy-propyl-methacrylamide-phenol, polyhydroxyethyl-aspartamide-phenol, or polyethyleneoxide-polylysine substituted with palmitoyl residues. Furthermore, the thrombin inhibitors may be coupled to a class of biodegradable polymers useful in achieving controlled release of a drug, for example, polylactic acid, polyglycolic acid, copolymers of polylactic and polyglycolic acid, polyepsilon caprolactone, polyhydroxy butyric acid, polyorthoesters, polyacetals, polydihydropyrans, polycyanoacrylates and cross linked or amphipathic block copolymers of hydrogels.

The dosage regimen utilizing the thrombin inhibitors is selected in accordance with a variety of factors including type, species, age, weight, sex and medical condition of the patient; the severity of the condition to be treated; the route of administration; the renal and hepatic function of the patient; and the particular compound or salt thereof employed. An ordinarily skilled physician or veterinarian can readily determine and prescribe the effective amount of the drug required to prevent, counter, or arrest the progress of the condition.

Oral dosages of the thrombin inhibitors, when used for the indicated effects, will range between about 0.1 mg per kg of body weight per day (mg/kg/day) to about 100 mg/kg/day and preferably 1.0-100 mg/kg/day and most preferably 1-20 mg/kg/day. Intravenously, the most preferred doses will range from about 0.01 to about 10 mg/kg/minute during a constant rate infusion. Advantageously, the thrombin inhibitors may be administered in divided doses of two, three, or four times daily. Furthermore, they can be administered in intranasal form via topical use of suitable intranasal vehicles, or via transdermal routes, using those forms of transdermal skin patches well known to those of ordinary skill in that art. To be administered in the form of a transdermal delivery system, the dosage administration will,

- 78 -

or course, be continuous rather than intermittent throughout the dosage regime.

For example, oral tablets can be prepared which contain an amount of active compound of between 100 and 500 mg, typically
5 between 200 and 250 mg. Typically, a patient in need of thrombin inhibitor compound, depending on weight and metabolism of the patient, would be administered between about 100 and 1000 mg active compound per day. For a patient requiring 1000 mg per day, two tablets containing 250 mg of active compound can be administered in the
10 morning and two tablets containing 250 mg of active compound can again be administered in the evening. For a patient requiring 500 mg per day, one tablet containing 250 mg of active compound can be administered in the morning and one tablet containing 250 mg of active compound can again be administered in the evening.

15 The thrombin inhibitors are typically administered as active ingredients in admixture with suitable pharmaceutical diluents, excipients or carriers (collectively referred to herein as "carrier" materials) suitably selected with respect to the intended form of administration, that is, oral tablets, capsules, elixers, syrups and the like,
20 and consistent with convention pharmaceutical practices.

For instance, for oral administration in the form of a tablet or capsule, the active drug component can be combined with an oral, non-toxic, pharmaceutically acceptable, inert carrier such as lactose, starch, sucrose, glucose, methyl cellulose, magnesium stearate,
25 dicalcium phosphate, calcium sulfate, mannitol, sorbitol and the like; for oral administration in liquid form, the oral drug components can be combined with any oral, non-toxic, pharmaceutically acceptable inert carrier such as ethanol, glycerol, water and the like. Moreover, when desired or necessary, suitable binders, lubricants, disintegrating agents
30 and coloring agents can also be incorporated into the mixture. Suitable binders include starch, gelatin, natural sugars such as glucose or beta-lactose, corn-sweeteners, natural and synthetic gums such as acacia, tragacanth or sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes and the like. Lubricants used in these dosage forms

- 79 -

include sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, sodium chloride and the like. Disintegrators include, without limitation, starch methyl cellulose, agar, bentonite, xanthan gum and the like.

5 The thrombin inhibitors can also be co-administered with suitable anti-coagulation agents or thrombolytic agents such as plasminogen activators or streptokinase to achieve synergistic effects in the treatment of various ascular pathologies. For example, thrombin inhibitors enhance the efficiency of tissue plasminogen activator-
10 mediated thrombolytic reperfusion. Thrombin inhibitors may be administered first following thrombus formation, and tissue plasminogen activator or other plasminogen activator is administered thereafter. They may also be combined with heparin, aspirin, or
15 warfarin.

Q is SCH_2 , or
 $(\text{CH}_2)_r$ where r is 1 or 2,

10 and pharmaceutically acceptable salts thereof.

6. A compound of Claim 3 having the structure:

wherein

15 Y, attached to a ring carbon atom, is H or NH_2 ;

R^1 , R^2 , and R^2' are independently
hydrogen,

phenyl,

20 mono- or di-halogenated phenyl,
naphthyl,
biphenyl,

a 5- to 7-membered mono- or bicyclic heterocyclic ring or
bicyclic heterocyclic ring system any ring of which may be
25 saturated or unsaturated, and which consists of carbon atoms and
from one to three heteroatoms selected from the group consisting
of N, O and S,

C1-4 alkyl,

branched C1-4 alkyl,

30 C3-7 cycloalkyl,

- 92 -

- C5-12 bicyclic alkyl,
C11-16 tricyclic alkyl,
R⁴(CH₂)_n,
(R⁴)₂CH, wherein R⁴ is the same or different.
5 (R⁴)(OR⁴)CH,
R⁴O(CH₂)_n, or
R¹ may be joined with R² to form a four- to seven membered
carbon ring in which zero to two carbon atoms may be substituted
with heteroatoms independently selected from the list N, O and S.
10 where n is 1, 2, 3 or 4;
R³ is
H,
(R²)₂N, wherein R² is the same or different.
R²'OCONH, provided R²' is not hydrogen,
15 R²CONH,
HO(CH₂)_p, where p is 0, 1, 2, 3 or 4,
R²'SO₂NH, provided R²' is not hydrogen, or
(R²)_mNCONH, where m is 1 or 2, wherein R² is the same or
different;
20 R⁴ is independently
phenyl,
mono- or di-halogenated phenyl,
naphthyl,
25 biphenyl,
a 5- to-7- membered mono- or bicyclic heterocyclic ring or
bicyclic heterocyclic ring system any ring of which may be
saturated or unsaturated, and which consists of carbon atoms and
from one to three heteroatoms selected from the group consisting
30 of N, O and S,
COOH,
C1-4 alkyl,
branched C1-4 alkyl,
C3-7 cycloalkyl,

- 93 -

C5-12 bicyclic alkyl, or
C11-16 tricyclic alkyl;

5 G is $(\text{CH}_2)_q$ where q is 1 or 2, or
 NR^1CH_2 ; and

Q is SCH_2 , or
 $(\text{CH}_2)_r$ where r is 1 or 2.

10 and pharmaceutically acceptable salts thereof.

7. A compound of Claim 3 selected from the group consisting of:

- 94 -

- 95 -

and pharmaceutically acceptable salts thereof.

8. A composition for inhibiting thrombin in blood comprising a compound of Claim 1 and a pharmaceutically acceptable carrier.

9. A composition for inhibiting formation of blood platelet aggregates in blood comprising a compound of Claim 1 and a pharmaceutically acceptable carrier.

- 96 -

10. A composition for inhibiting formation of fibrin in blood comprising a compound of Claim 1 and a pharmaceutically acceptable carrier.

5 11. A composition for inhibiting thrombus formation in blood comprising a compound of Claim 1 and a pharmaceutically acceptable carrier.

10 12. A method for inhibiting thrombin in blood in a mammal comprising administering to the mammal a composition of Claim 8.

15 13. A method for inhibiting formation of blood platelet aggregates in blood in a mammal comprising administering to the mammal a composition of Claim 9.

20 14. A method for inhibiting formation of fibrin in blood in a mammal comprising administering to the mammal a composition of Claim 10.

15. A method for inhibiting thrombus formation in blood in a mammal comprising administering to the mammal a composition of Claim 11.

25 16. A method for inhibiting thrombin in stored blood comprising administering to the mammal a composition of Claim 8.

30 17. A method for inhibiting formation of blood platelet aggregates in stored blood comprising administering to the mammal a composition of Claim 9.

18. A method for inhibiting formation of fibrin in stored blood comprising administering to the mammal a composition of Claim 10.

- 97 -

19. A method for inhibiting thrombus formation in stored blood comprising administering to the mammal a composition of Claim 11.

5 20. The use of a compound of Claim 1, or a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for inhibiting thrombus formation, preventing thrombus formation, inhibiting thrombin, inhibiting formation of fibrin, and
10 inhibiting formation of blood platelet aggregates, in a mammal.

PCT/US96/04460

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

Please See Extra Sheet.

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
7, and 1-6, 8-20 (in part) GQ=(CH₂)₃, A=N no other hetero ring anywhere

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.

BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING

This ISA found multiple inventions as follows:

This application contains the following inventions or groups of inventions which are not so linked as to form a single inventive concept under PCT Rule 13.1. In order for all inventions to be examined, the appropriate additional examination fees must be paid.

Group I, claim 7, and the subject matter of claims 1-6,8-20 (in part) wherein GQ=-CH₂-CH₂-CH₂-, A=N, no other hetero ring of any kind in all other variables.

Group II, claims 1-6,8-20(in part) wherein GQ=-CH₂-CH₂-, A=N, no other hetero ring of any kind in all other variables.

Group III, claims 1-6,8-20(in part) wherein GQ=-CH₂-CH₂-CH₂-CH₂-, A=N, no other hetero ring of any kind in all other variables.

Group IV, claims 1-6,8-20(in part) wherein GQ=-N-CH₂-CH₂-, A=N, no other hetero ring in other variables.

Group V, claims 1-6,8-20(in part) wherein GQ=-N-CH₂-CH₂-CH₂-, A=N, no other hetero ring in other variables.

Group VI, claims 1-6,8-20(in part) wherein GQ=-N-CH₂-S-CH₂-, A=N, no other hetero ring in other variables.

Group VII, subject matter of group I but A=C.

Group VIII, subject matter of group II but A=C. Group IX, subject of group III but A=C.

Group X, subject matter of group IV but A=C.

Group XI, subject matter of group V but A=C.

Group XII, subject matter of group VI but A=C.

Group XIII, the remaining subject matter containing different hetero ring in other variables.

The inventions listed as Groups I-XIII do not relate to a single inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons: the compounds of above groups do not share a common core structure and are not so linked as to be obvious variants (equivalents) of each other and they are not interchangeable bioisosteres.
